

Comments:

Through correctly identifying our critical path we were able to plan effectively by choosing to prioritise tasks that were involved in the critical path in order to finish on time. This allowed us to fully complete all our user stories we planned on doing for this sprint

We were able to assign our group members efficiently and easily as we knew which tasks could be completed independently from others, so people could work on other tasks while waiting for someone to finish the dependent task. This meant work could always be done as no one was left waiting on others before starting their work.

We identified times other than the most critical path which helped decide a hierarchy of prioritising where taskless people would choose tasks on the most critical path which weren't already taken by others which minimized any time where people needed to wait on others.

Furthermore, since we knew that a group member would be getting their COVID-19 vaccine, we did not give them any tasks that had a lot of tasks depending on them. As a result, their side-effects had a minimal impact on the completion of the project.
